- Tailwind
- Express
- AdonisJs
- Web Scraping
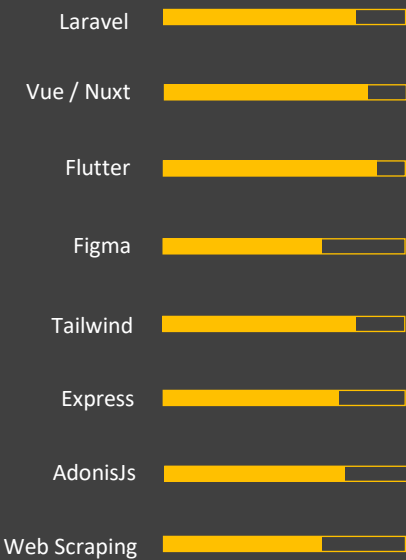

EDUCATION

SMPN 7 Malang	2015-2018
SMKN 4 Malang	2018-2021

WORK EXPERIENCE

Intern Developer Ezy Industries 2019 - 2020

In Ezy Industries I act as an Intern Developer to help with several projects in the company. During my internship here, I learned so many things through assignments that were not even taught in my school. Some of the tasks given to me are as follows.

- Developed a company-owned android application, namely Remap.
- Develop multiple websites and work on them in a team.

PORTFOLIO

Remap (Dec 2019 – Jun 2020)

As a Intern Developer I was assigned to help develop this Remap application. I started working in December. The things I have developed include improving the comment feature, tidying styles, and creating layouts for the Ofis feature. Then around June I quit this assignment and was given another assignment by the company.

Baca Tarot (Jul 2020)

Baca Tarot is a website for fortune telling. Honestly this is my first Vue project and at that time I wasn't very good at using this framework. But I started to really understand when I see the code belonging to my team member, his code is very clean and easy to understand.

Ngaji Lagi (Jul 2020 – Aug 2020)

Ngaji Lagi is a website to help users learn the Quran from scratch and is guided by people from the client side. This project uses a template from a previous client project, Baca Tarot. In this project I cloned from Baca Tarot and changed a few. Then around October I was assigned again to create a frontend for the Admin Dashboard.

Bibo (Aug 2020 – Sep 2020)

Bibo is an e-commerce website to buy some books for children. This project has a team and its members include Alfan Hidayatullah (Project Manager), Adam Rafi (Backend), Ivan Reyhan (Frontend) and I (Fullstack). This project is one of the programs provided by SMK Coding because one of the cooperation programs is the SMK Coding Challenge. Previously in this project I was made an Assistant Project Manager by my Project Manager, but because there were some obstacles, so whether I wanted to or not, I had to be a Fullstack here. The technology used to create this website includes Lumen as the backend and Vue as the frontend. The demo project is hosted on Heroku and this project also lasts for 5 weeks.

Alkademi (Jul 2020 – Sep 2020)

Alkademi is an organization Python that offers learning services and collaborates with Ezy Industry. In this project my friend Son Gohan and I worked on it using Vuejs and Strapi and this is the first time I have implemented my knowledge about Tailwind and Strapi Headless CMS.

Sumpah Pemula (Oct 2020 – Nov 2020)

Sumpah Pemula is a volunteer website devoted to Youth Pledge Day where on this website we can submit ourselves as volunteers who later we will be contacted for a project. Not only submitting volunteers, other agencies can also submit to ask for help with their own projects. In this project I worked on it with Mr. Alfan Hidayatullah using the Nuxt as the frontend and Firebase Functions as the backend. The deadline for this project is very tight and there was a problem that I accidentally deleted the contents from the database. But luckily I contacted Firebase Support and was able to return the data back. I am very grateful to Firebase.
